# Linking Objects and/or Libraries into PSCAD

1. If you have an object file (and no library)

- Ensure that all project files are together in the same folder on your computer
  (i.e. your PSCAD project and the object/s).

- Display the Project Settings dialog for your <u>PSCAD</u> case, display the "Link" tab, and <u>delete</u> any text in the "files" field:
- Click on the "Browse" button and select your object file. The "files" field should now be populated.

  Note
  When entering multiple object files in this field, they may be separated with a space, a comma or a semicolon.

- Select "OK" to apply the change and close the Project Settings dialog box.
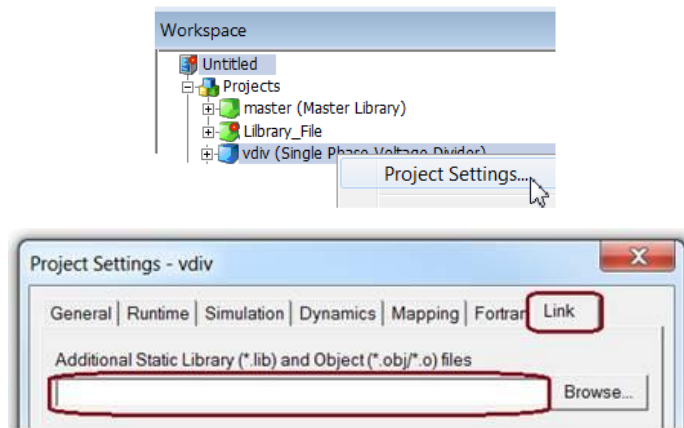

- Try running your project.

2. If you are using a library (and no object file):

- Ensure that all project files are together in the same folder on your computer (i.e. your PSCAD project and the library).

- Ensure that the library is loaded ahead of (above) the PSCAD project in the Workspace. For example, see below, the "Library_File" appears above the corresponding project, "vdiv":

- Display the Project Settings dialog for your PSCAD case, display the "Link" tab, and <u>delete</u> any text in the "files" field:

   Note
   No linking is required when using a library.

- Select "OK" to apply the change and close the Project Settings dialog box.

- Try running your project. Your project should automatically use the library components when called.
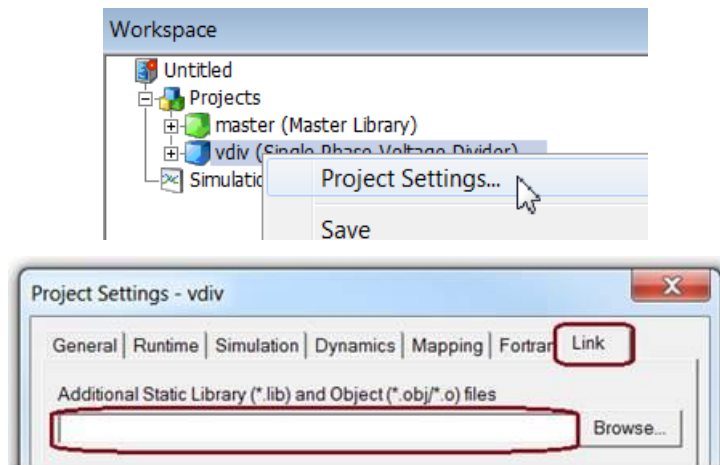

3. If you have both a library and an object:

- Ensure that all project files are together in the same folder on your computer
  (i.e. your PSCAD project, the library, and the object/s).

- Ensure that the library is loaded ahead of (above) the PSCAD project in the Workspace. For example, see below, the "Library_File" appears above the corresponding project, "vdiv":

- Display the Project Settings dialog for your PSCAD case, display the "Link" tab, and <u>delete</u> any text in the "files" field:

> **Note**
> No linking is required when using a library.

- Select "OK" to apply the change and close the Project Settings dialog box.

- Display the Project Settings dialog for your <u>library</u>, display the "Link" tab, and <u>delete</u> any text in the "files" field:

- Click on the "Browse" button and select your object file. The "files" field should now be populated.

Note
When entering multiple object files in this field, they may be separated with a space, a comma or a semicolon.

- Select "OK" to apply the change and close the Project Settings dialog box.

- Try running your project. Your project should automatically use the library components/objects when called.
